On page 213 of volume 27 no 2, figures 5 should be replaced with the following ones (where figure 5a is unchanged):

Figs.5 – Representation of our Superluminal Splash Pulses (SSP), eq.(17). They are suitable superpositions of SFWMs (cf. Fig.4), so that their total energy is *finite* (even without any truncation). They however get deformed while propagating, since their amplitude decreases with time. In Fig.5a we represent, for $t = 0$, the pulse corresponding to $V = 5c$, $a = 0.001$ m, and $b = 200$ m. In Fig.5b it is depicted the same pulse after having traveled 50 meters.
